Appendix b)

Details on respiration measurement

The animals were kept separately from each other in plastic boxes with moist sand (except for earthworms and diplopods that were kept in forest soil and beech litter, respectively) stored in climatic chambers (constant 15° C), and they were fed adequately but fasted for some time prior to the respiration measurement to avoid down regulation of metabolism due to starvation. Approximately two hours prior to the experiments, the individuals were transferred to incubators with the experimental temperature level. Preliminary experiments and survey of respiration time series (see below) ensured that this time was sufficient for adjusting to the environmental temperature while excluding initial short periods of temperature shocks. This excluded (1) acclimation or evolutionary adaptation of the animals to the various measurement temperatures over this relatively short experimental time period (see Terblanche *et al.* 2005; Lachenicht *et al.* 2010 for examples), and (2) confounding effects of very different levels of hunger that would be a consequence of longer acclimation periods. Together, these experimental procedures allowed focusing on standard metabolic rates.

Each individual was weighed with a precision scale prior to the measurement. Our measurements of oxygen consumption lasted for 12 h at each of six temperatures (5, 10, 15, 20, 25, and 30° C) and were conducted in a closed system with oxygen supply to avoid oxygen depletion. This automated electrolytic microrespirometer (see Scheu 1992 for a detailed description) keeps the partial pressure of oxygen constant by releasing oxygen pulses since the decrease of oxygen is measurable as a decrease in pressure as the emerging CO₂ is buffered. Oxygen-release pulses are logged in 15 minutes intervals as time series. The respiration between the 8th and the 12th hour was averaged to obtain the standard

24 metabolic rate per hour ([J/h], 1 ml O₂ = 20.1 J, Peters 1983). During these hours respiration has usually
25 saturated at constantly low respiration levels indicative of standard metabolic rates. Inspection of the
26 oxygen-pulse time series allowed removing time series with non-saturated, elevated rates (possibly due
27 to specific dynamic action) or periods of activity as indicated by sudden increases in oxygen pulses.

Appendix c)

Analyses of the data set excluding data from Chown et al. (2007)

The data set of Chown et al. (2007) includes metabolic data that have been adjusted to 25°C. We repeated the analyses of our main manuscript employing a reduced data set without the data of Chown et al. (2007) to detect a possible effect of the temperature-adjusted metabolic rates on our conclusions. The statistical methods were the same as those described in the methods section of the main manuscript.

Table 1: Results of the fits of the three models: linear, polynomial and phylogenetic model.

Figure 1: Metabolic scaling according to the linear model: dependence of partial residuals of the natural logarithm of metabolism on (a) the natural logarithm of body mass and (b) temperature with the fitted multiple linear model (black line). In these partial residual plots, metabolism is plotted against one of the independent variables while accounting for the effect of the other. Distributions of the linear model's residuals (deviation of data points from black line in panels a and b) across (c) the natural logarithm of body mass and (d) temperature characterized by deviations of the loess fit (brown curves) from the 95% confidence bands (dotted black bands). See Table 1 for parameters of the fitted linear model. Note that statistical fits employed inverse temperature terms, whereas figure axes were labelled with temperature.

Figure 2: Accuracy of polynomial and phylogenetic models: distributions of the residuals for the polynomial (a, b) and the phylogenetic model (c, d) across the natural logarithms of body mass (a, c) and temperature (b, d). Systematic deviations of the data from model predictions are characterized by loess fits (brown curves). See Table 1 for parameters of the fitted polynomial and phylogenetic model.

Figure 3: Distribution of fitted metabolic scaling parameters and their 95% confidence limits in the phylogenetic model across phylogenetic groups: (a) intercepts, (b) allometric exponents and (c) activation energies. Parameters of the linear model (all groups) have been included. Indications of model predictions: (b) dashed line equals $3/4$ (MTE); gray and dark gray areas indicate ranges $2/3 - 1$ and $2/3 - 3/4$, respectively (alternative models); (c) the dark gray area indicates range -0.6 to -0.7 eV and the dashed line the mean 0.65 eV (MTE); the light gray area depicts range -0.46 to -0.96 eV.

Results

109

110 The reduced data set consists of 3026 metabolic rates. Fitting the linear model resulted in an allometric
111 exponent, a , of 0.679 (std error ± 0.007 , Table 1, Fig. 1a) differing significantly from the $\frac{3}{4}$ exponent
112 predicted by the MTE (t-test, $p < 0.001$), whereas the activation energy, E , of 0.678 eV (std error ± 0.011 ,
113 Table 1, Fig. 1b) was within the predicted range (0.6 – 0.7 eV).

114 To assess curvatures in the relationships, we analyzed the dependence of the linear model residuals on
115 the natural logarithms of body mass and temperature ($1/(kT)$) and tested for deviation from linearity by
116 “loess fits”. These patterns suggest non-linear deviations from the linear model.

117 We accounted for non-linearities by fitting the polynomial model. Comparisons of the “loess fits”
118 between the linear model (Fig. 1c, d) and the polynomial model (Fig. 2a, b) show that polynomials
119 removed most of the curvature. The AIC of the phylogenetic model (4914) is much lower than the AICs
120 of the linear (AIC: 5798) and the polynomial model (AIC: 5713).

121 Overall, these results are entirely consistent with those presented in the main text. This suggests that the
122 temperature adjustment to 25 °C and the mixing of inter- and intraspecific data in this data set do not
123 affect the conclusions of the main text.
